

To the World Leaders! To the People of the World! Victory Over Cancer Is Possible!

Ending the 'Age of Fear'

At the beginning of the 21st century, cancer remains one of the largest epidemics haunting mankind. The annual global death toll from cancer equals the entire population of New York City.

Despite generations of new 'chemotherapy' drugs introduced, the 'survival rates' of most types of advanced cancers have remained at the same dismal level as half a century ago.

During the four decades since the US Government has declared 'War on Cancer' the number of people killed from this disease equals that of the entire population of the USA.

Here we present a research breakthrough that promises to end the 'Age of Fear' and turn cancer from an almost certain 'death verdict' into a manageable disease.

Natural Control of Cancer Cell Spread—The 'Holy Grail of Medicine'

On May 12, 2002, in a landmark article, the *San Francisco Chronicle* described the control of cancer invasion as the still elusive 'Holy Grail of Medicine'.

Here we present the answer to this important search based on the initial discovery of the natural control of cancer by Dr. Rath and more than a decade of pioneering research at our Institute in California.

1. Cancer cells – without exception and irrespective of their origin – use the same mechanism for spread and metastasis: the digestion of collagen and connective tissue.

2. The hallmark of every cancer cell – beside continuous multiplication – is the unlimited production of collagen digesting enzymes (plasminogen activators, metalloproteinases) functioning as 'biological scissors' that allow cancers to grow invasively and metastasize.

3. The degree of malignancy of any type of cancer is largely determined by the produced amount of 'biological scissor' enzymes.

4. The aggressive nature of the cancer disease can now be also explained: Cancer cells abuse a mechanism – enzymatic collagen digestion – that is already used by our body under normal, physiological conditions, including the migration of white blood cells during infection, of egg cells during ovulation as well as the process of tissue restructuring during pregnancy, lactation and growth. This 'biological camouflage' by cancer cells leaves our body largely defenseless against this disease.

5. Our research over more than a decade has consistently shown that certain micronutrients are able to selectively inhibit the uncontrolled digestion of connective tissue by cancer cells, while not affecting physiological processes. Towards this

goal, certain vitamins, amino acids, green tea extracts and other science-based plant derivatives act synergistically, allowing maximum effects with moderate amounts of these natural substances.

6. Moreover, our research has documented that all key mechanisms of cancer disease can be inhibited by this micronutrient synergy, including tumor cell multiplication (growth), invasion (metastasis) and the formation of new tumor blood vessels (angiogenesis). Micronutrients can also reverse the immortality of cancer cells and induce natural death of cancer cells (apoptosis).

7. First clinical studies have proven the effectiveness of these natural, safe and affordable approaches. A clinical study conducted at the *Mayo Clinic* showed that polyphenol extracts from green tea can halt and even reverse early stages of leukemia, naturally. Recently, the *Journal of Clinical Oncology* published a list of 100 clinical studies with micronutrients currently underway at the world's leading cancer research centers and academic institutions.

8. Mankind is currently witnessing one of the great transformations in Medicine. The 'Era of chemical intoxication' of cancer patients – indiscriminately killing cancer and healthy cells alike – is being replaced by the 'Era of biological regulation' – selectively inhibiting and eliminating cancer cells.

Dr. Matthias Rath

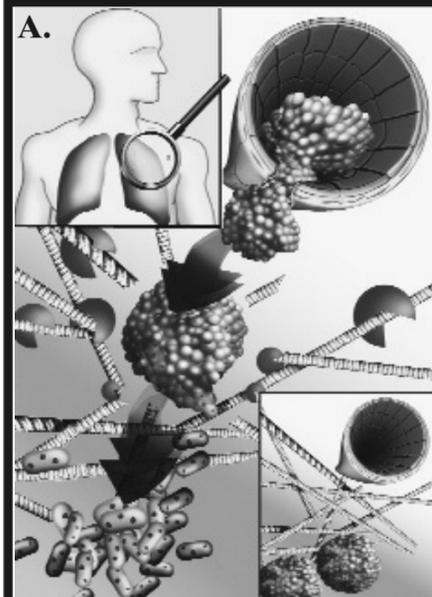

Dr. Rath was privileged to discover the principle mechanism of cancer control by specific micronutrients. For his exposure of the pharmaceutical investment 'business with disease' as the biggest obstacle to the prevention and elimination of diseases, he has become the focus of attacks by the global drug cartel lobby (www.wiki-rath.org).

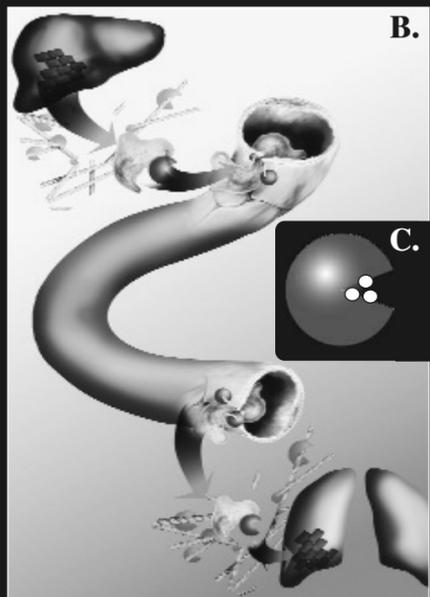

Dr. Aleksandra Niedzwiecki

Dr. Niedzwiecki is the head of the Dr. Rath Research Institute and has been coordinating the scientific research confirming this breakthrough in human health.

Controlling Cancer Begins With Understanding Its Cellular Mechanisms

A. Under normal (physiological) conditions, many cells use collagen-digesting enzymes as 'biological scissors' to move through the body. Among such migrating cells are white blood cells (leucocytes), shown here 'chewing' through the blood vessel wall and the lung tissue to fight a pneumonia infection. Under such normal conditions, the mechanism of collagen-digestion is tightly controlled.

B. Under disease (pathological) conditions, cancer cells use the same mechanism – but uncontrolled – to spread and metastasize. This graph shows cancer cells from a liver tumor 'chewing' their way into a blood capillary and leaving the blood stream again in the lung to metastasize.

C. Specific micronutrients (white circles) inhibit uncontrolled collagen digestion by cancer cells.

The Deadlocks of 'Chemotherapy'

Before addressing new approaches, we have to understand why conventional cancer therapies were unable to win the 'War on Cancer':

1. Over the past half century, the cancer epidemic has been turned into the single largest market for patented pharmaceutical drugs.

2. The widespread use of highly toxic chemicals as so-called 'chemotherapy' has given rise to a myriad of 'side effect diseases' including anemia, inflammation, organ damage – each of which represents another multi-billion dollar drug market.

3. To protect these giant global markets, the special interests behind the investment 'business with cancer' have built a 'smoke screen' of research. While addressing these 'mosaics' of specific cancer types they consistently neglected the 'big picture', the mechanism common to all types of cancer: collagen digestion as the precondition for invasive spread and metastasis.

4. Considering the fact that over 90% of all cancer deaths occur during cancer metastasis, this negligence affects the health and lives of millions and is no longer acceptable.

The 'Alarm Call' by the United Nations

In response to this unacceptable situation, the governments of over one hundred nations gathered at the United Nations have called for a 'concise action plan' to cope with the 'rising incidence' and the 'social and economic impact' of cancer and other diseases.

2. The scientific facts about micronutrient deficiencies as an underlying cause of many diseases has been completely omitted. At the same time, the benefits of micronutrient-rich nutrition and supplementation have been entirely ignored.

3. Hardly any practical and affordable solutions have been proposed to cope with cancer and other diseases in the developing world. No mention was made of community gardening and other local, regional and national programs to promote micronutrient-rich nutrition.

No one should be surprised about this outcome. The comprehensive health benefits of non-patentable micronutrients threaten the global markets of drug companies – and their 'gatekeepers' took part in the preparation of this meeting.

1. Repetitive recommendations of a low-salt, low-fat diet and smoking cessation, while valid measures, are completely inadequate to effectively control cancer and other severe diseases.

"The right for ourselves, our children and grandchildren to live in a world without cancer will not be given to us voluntarily. To achieve 'victory over cancer' – against the resistance of those investment interests that thrive on the cancer epidemic as a multi-trillion dollar drug market – is the next great goal uniting all of mankind." Dr. Rath

Liberating the Industrialized and Developing World From the Economic Burden of Cancer

Among all the business models of the drug industry, the 'business with the cancer epidemic' is particularly fateful. The fact that the extreme toxicity of its alleged treatment, chemotherapy, triggers an incessant spiral of new diseases, posts a huge economic burden on patients and societies.

ized countries and the worsening economic dependency of the developing world. In turn, terminating the 'business with the cancer epidemic' is a precondition for the economic recovery of industrialized nations and for bridging the gap between rich and poor nations.

The global annual economic burden in health care costs and national income losses from the ongoing cancer epidemic amounts to trillions of dollars. Thus, the continuation of the cancer epidemic is a major contributing factor to the current economic crisis in industrial-

"Controlling vitamin and mineral deficiency is an affordable opportunity to improve the lives of two billion people and strengthen the pulse of economic development".

'Vitamin and Mineral Deficiency' Global Progress Report UNICEF et al. 2004

Call For a Cancer Free World!

Based on scientific advances in the field of natural health, the historic opportunity exists to significantly reduce and eventually eliminate cancer as one of the most dreaded diseases of our time!

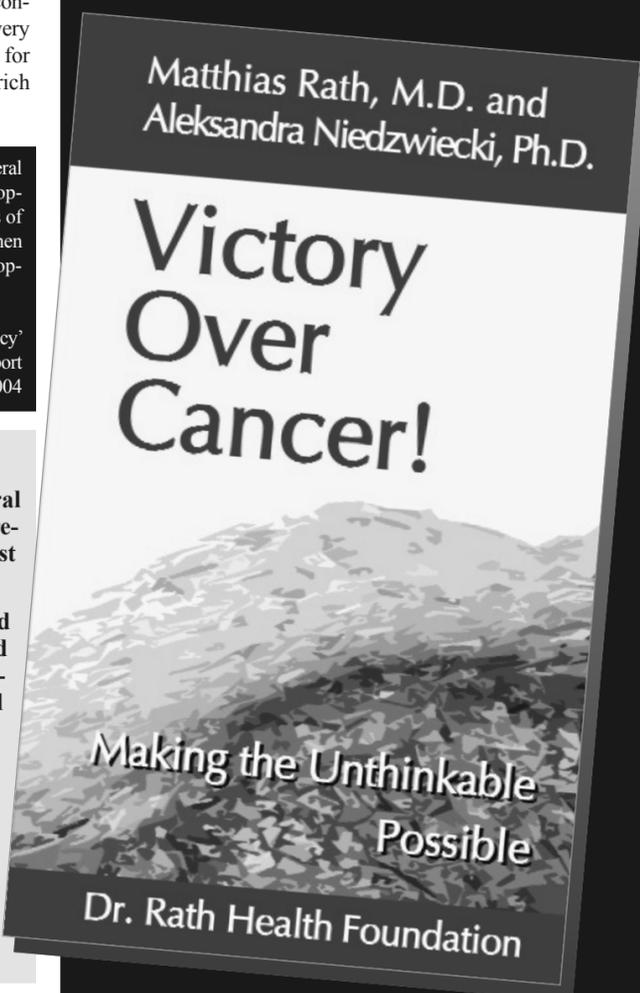

At this historic moment, we, as the scientists who lead this breakthrough, call upon the people of the world to take responsibility for their health and work towards a 'Cancer Free World' as the next great goal uniting all mankind!

Considering the colossal dimension of human and economic costs of the ongoing cancer epidemic – delay and indifference are not options!

The book 'Victory Over Cancer' serves as an educational guide towards this goal. It also provides the blueprint for an independent and prevention-oriented global health care.

Dr. Waheed Roomi (second from left) and other members of the research team who contributed to this scientific breakthrough. For research publications see: www.drathresearch.org

The time for mankind to unite and create a cancer free world for this and all future generations is now!
